Evosys Laser is growing and moving to new premises

Due to rapid growth, Evosys Laser GmbH has moved to new premises. Just two years after its founding, larger areas and a better working environment are now available at the new location.

Erlangen, February 2018: At the end of the year 2015, the high-tech forge was founded by an experienced team of systems engineering for laser material processing. After the initial period in the company building of the investor and partner Intego GmbH, the need to enlarge the premises was already apparent at the beginning of 2017. More laboratory space and capacities were quickly needed to build the laser systems, and the number of employees increased rapidly within a few months

The positive business development allowed the renting of own rooms at the end of last year. Frank Brunnecker, Managing Director of Evosys Laser GmbH, is pleased: "At the new location, we can offer our customers even better services in a larger Technical Center. In addition, our team now not only has its own production hall, but also attractive office and meeting rooms."

Besides to the good working environment, the good transport connections were also decisive for the choice of the new location. In addition, it offers a representative appearance for customer visits and the opportunity for further growth.

About Evosys Laser:

Evosys Laser GmbH develops and manufactures a new generation of tailor-made laser systems for material processing at its Erlangen location. With the long-term market and process experience of its employees, the company offers worldwide creative and innovative solutions for integration into automation solutions. The core competence of the company is laser welding of plastics. This comprises every aspect linked to this technology – from product and process development, welding of sample parts, design and engineering of production equipment according to customers' requirements to successful transfer into mass production based on the Evosys standard modules and machines for laser plastics welding. During lifetime of the product the very skilled and
